Summary of the finished sprint

Madina Khaimuldina

Start date	End date	Ulugbek Norbutaev	Emmanuel Omotobora	Carla Otero	Carla Susana López	Madina Khaimuldina
16/10/2026	30/10/2026	Run Express and connect session registration/login	Set up collaboration and build the small template shell	Learn the schema and create the first migrations	Audit one dataset and freeze the prediction input contract	Write the question, one-page evaluation rule and requirements

2. Summary of the finished sprint.

Finished tasks	Check descriptive statistics and validation metrics independently (S2-ST-01): independently re-derived LR and Dummy validation metrics from row-level predictions.Verified split IDs are disjoint, cover all 395 records and match the published manifest. Wrote and ran an independent G1 statistics test, published the audit script, evidence report and comparison table; requested review from AI.
Unfinished tasks	None
What went well?	The independent audit matched Carla's numbers exactly on the first run - same confusion matrix, same metrics to four decimal places - which confirmed both the split and the model evaluation were done correctly on each side. Comparing the two candidates side by side made the

	imbalance problem concrete: the Dummy baseline's 0.68 accuracy looked fine on paper but it never flagged a single at-risk student (recall 0.0), while Logistic Regression caught 16 of 19.
What (and how) could be improved?	My test failed at first for a setup reason (running the code on the 3rd Step), not a code reason: my computer's Node.js version didn't match what the project needed, so a required package couldn't install. Once I switched to the right Node version, the test ran fine. Next sprint, I'll check the project's required Node version before running anything, instead of debugging the error after it happens.
